8. What happen to the brain when a word is said?
9. How much money has our government spent on solving poverty?
10. How much did it help, and what does the speaker believe will help solve poverty?

NOTE: It is a misconception that the life expectancy in 1 A.D. was 20-30 years. If a person made it to 13 years old there was an exceptionally good chance of them making it to at least 50 or more years. In fact was quite common for there to be people who were in their 70s, at least one in every small cluster of people. In truth the life expectancy of 20-30 years applies mainly to the pre-historic era when we were hunter gatherers, and ever since we started farming that has changed dramatically.
